

Does the Psi-NN advantage persist under hardware compression?

Linear reference vs. strongest combined Rapp compression tested (TX 0 dB / RX 0 dB)

Means across 3 simulation seeds; shaded gap bands show seed minima-maxima, not confidence intervals.
Recalibrated thresholds target $P_{fa} = 0.01$. Compression: mean measured $P_{fa} \approx 0.0091$ (CAE), 0.0100 (Psi-NN).
